What Should the Streaming Data Solution Do?

WHAT IT MUST DO

Plug straight into Solace — take events in, and send answers back out when they matter.

Remember things and stay up on its own — no separate database to run.

Answer AI on demand — hand it a ready-made picture, or alert it when things change.

Combine several live feeds — show separate systems as one picture, in real time.

Stay current and fix itself — update as things happen; never a stale snapshot.

Never lose or double-count data — every event handled once, reliably.

WHAT IT CONNECTS TO & HOW IT RUNS

Connect to Nisshi (formerly Tansu) — out of the box.

Connect to lots of other sources — databases, files, data lakes, and other live feeds.

Be designed in Event Portal — map the important business facts and how they flow, and keep them governed.

Be built by people who know SQL — your analysts, not a specialized streaming team.

Run as one shared building block — not a new app for every use case.

Be governed and easy to watch — clear data, controlled access, simple to monitor.

The checklist we hold every option to.

How Clients Do This Today

checks on a timer —
always a step behind

WHAT IT COSTS YOU

✗ Always a step behind — the app only checks now and then, so answers are old.

✗ Feeds aren't combined live — someone has to stitch them together in code.

✗ Yet another database to run — storing it and keeping it up is your problem.

✗ An app for every use case — each new question means building and running another one.

✗ Nothing comes to you — everyone has to keep asking; nothing wakes the AI.

✗ You own getting it right — no built-in guarantees, and it won't fix itself.

Every box ticked halfway, by hand — and always a step behind.

solace.

How Flink Would Do It

WHAT FLINK ASKS OF YOU

Write and deploy code — a programming project, plus a cluster to size and run.

Tune it by hand — lots of low-level settings only specialists understand.

No way to just ask it a question — you build a second system to serve answers.

Combining live feeds is the hard part — careful setup, and constant babysitting.

Specialists own it forever — not your analysts, and never a simple "turn it on."

Wire up every connection yourself — no built-in Solace hookup or Event Portal design.

IN THE CUSTOMER'S WORDS

DIFFERENT TOOL

"[The engine] felt more like a real-time database, while Flink felt more like a developer-oriented stream processing platform… it would require more specialized engineering effort to build, operate, and maintain."

DIFFERENT PEOPLE

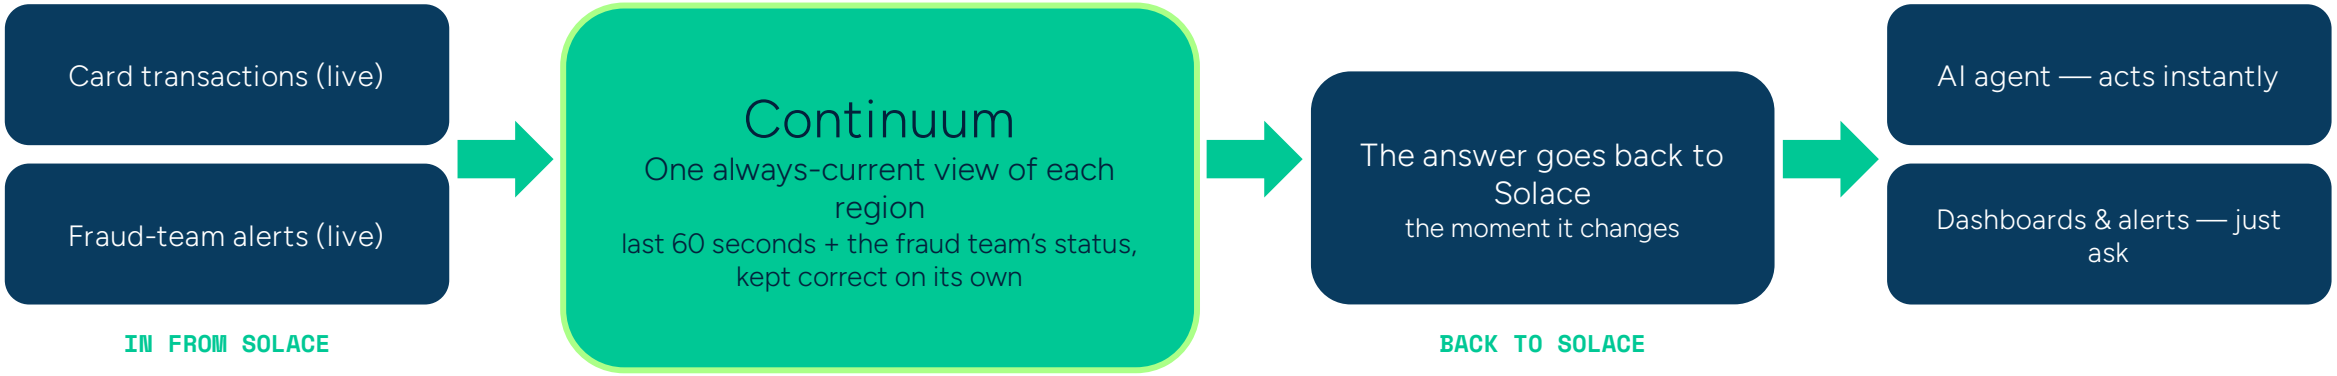

"The SQL-first model… opens the door for business analysts comfortable with SQL to help build live data products… move faster instead of everything having to wait on specialized IT skills."

— Enterprise Architect, Vancouver Airport Authority (July 2026)

Flink can do most of this — but it's a system you staff and run. Continuum is something you switch on.

solace.

How Continuum Does It

WHAT YOU GET

✓ Always current — it updates itself the moment something changes; never a stale snapshot.

✓ Combines feeds live — two systems shown as one picture, automatically.

✓ Remembers and stays up on its own — no separate database to run.

✓ One shared building block — not a new app for every use case.

✓ Comes to you or waits for you — alert the AI the instant things change, or answer when asked.

✓ Trustworthy by default — nothing double-counted, nothing missed; it fixes itself.

Everything on the checklist, built in — and it's exactly what you saw in the demo.
